

Socket fit is vital to the comfort, suspension, control and acceptance of a lower extremity prosthesis.

## Symphonie Aqua Pad

**HYDROSTATIC**

**TOTAL SURFACE WEIGHT BEARING**

**INDIVIDUAL**

The New Symphonie Aqua Pad is designed for consistent and precise casting of knee disarticulations, partial foot and symes amputations. It can be used alone or in conjunction with the Symphonie Aqua System.

The Aqua Pad's hydrostatic membrane distributes body weight uniformly, capturing a precise impression of all anatomical contours.

The accuracy of the impression allows the practitioner to create a socket that will accommodate pressure sensitive areas.

Consistently give your patients comfortable, well fitting sockets while significantly reducing/eliminating the need for cast modifications and multiple check socket fittings.

Socket fit is vital to the comfort, suspension, control, and acceptance of a lower extremity prosthesis. The biggest challenge for the practitioner is to consistently and accurately capture limb contours and tissue displacement as they would be under load. With traditional, non-weight bearing casting methods, it is impossible to accurately capture a limb under weight bearing conditions exactly as they would be inside a prosthetic socket.

While casting with the Symphonie Aqua System, optimal hydrostatic pressure is applied to the limb while in full weight bearing. The individual's body weight and tissue

contours under weight bearing can then transfer perfectly and evenly to the casting material, thus capturing an impression that accurately reflects the limb under full weight bearing conditions.

The full contact and weight bearing that the patient experiences during the casting process also provides excellent proprioceptive feedback to the patient who can then give the practitioner valuable information concerning bony and sensitive parts of the limb before the socket is made.

# Symphonie®

## Aqua System

Let's Sum Up the Advantages...

The Symphonie Aqua System allows the practitioner to:

- Consistently and efficiently capture an accurate impression of limb exactly as it would be under weight bearing conditions
- Know about sensitive and problem areas before socket is created.
- Facilitate maximal clinical efficiency by reducing or eliminating the need for cast modifications and multiple check socket fittings.
- Increase patient satisfaction via increased comfort and faster functional progression.
